

Java Exception Handling Lab Report

Program: FileNotFoundException

1. Aim

To demonstrate handling of FileNotFoundException in Java when a file is missing or inaccessible.

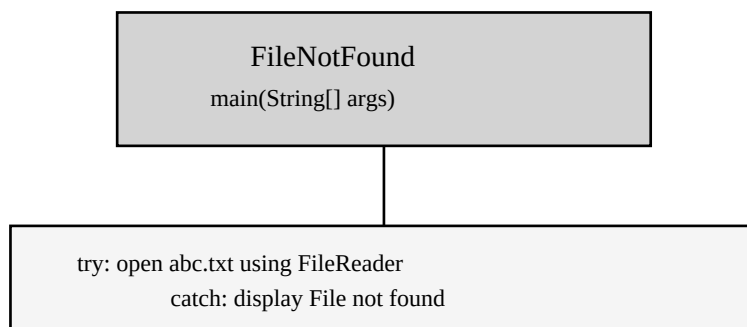

2. Description

FileNotFoundException is a checked exception that occurs when a file cannot be opened, usually because it does not exist, the path is invalid, or access is denied. In this program, FileReader attempts to open abc.txt inside a try block. If the file is unavailable, the catch block displays an appropriate message.

3. Tools Used

- Java Development Kit (JDK)
- Java compiler (javac)
- IDE or command prompt
- Operating system

4. UML / Program Structure

5. Algorithm

1. Start the program.
2. Import the java.io package.
3. Attempt to open abc.txt using FileReader inside the try block.
4. If the file is missing or inaccessible, FileNotFoundException occurs.
5. Catch the exception using the catch block.
6. Display "File not found".
7. Stop the program.

6. Complete Java Source Code

```
package exceptions;
import java.io.*;

public class FileNotFoundException {
    public static void main(String[] args) {
        try {
            FileReader f = new FileReader("abc.txt");
```

```
        //Handling missing or inaccessible files
    } catch (FileNotFoundException e) {
        System.out.println("File not found");
    }
}
```

7. Sample Output

```
File not found
```

8. Result

The program successfully demonstrated FileNotFoundException handling. When abc.txt is missing or inaccessible, the exception is caught and the message “File not found” is displayed.
