

PartA – Book Class Program Lab Report

1. Aim

To develop a Java program using a class and object to store and display the details of a book, including book ID, book name, author, and price.

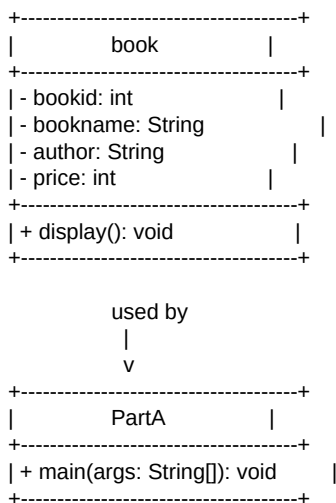

2. Description

The program belongs to the package **tasktwo** and contains a class named **book** and a public class named **PartA**. The book class contains four data members: bookid, bookname, author, and price. The display() method prints the book details. In the main() method, an object of the book class is created, values are assigned to its data members, and the display() method is called.

3. Tools Used

- Programming Language: Java
- Development Environment: Any Java IDE or text editor
- Execution Tool: Java Development Kit (JDK)
- Concepts Used: Class, object, data members, method, object creation, and member access

4. UML Class Diagram

5. Algorithm

1. Start the program.
2. Define the book class with book ID, book name, author, and price data members.
3. Define the display() method to print the book details.
4. Create an object b of the book class in the main() method.
5. Assign values to the book ID, book name, author, and price.
6. Display a heading message.
7. Call the display() method using the object b.
8. Print all book details.
9. Stop the program.

6. Complete Java Source Code

```
package tasktwo;

class book {
    int bookid;
    String bookname;
    String author;
    int price;

    void display() {
        System.out.println("Bookid is:" + bookid);
        System.out.println("Book name is:" + bookname);
        System.out.println("Author is:" + author);
        System.out.println("price is:" + price);
    }
}

public class PartA {
    public static void main(String[] args) {
        book b = new book();

        b.bookid = 238;
        b.bookname = "core java";
        b.author = "james gosling";
        b.price = 250;

        System.out.println("The above details are about the core java book");
        b.display();
    }
}
```

7. Sample Output

The above details are about the core java book
Bookid is:238
Book name is:core java
Author is:james gosling
price is:250

8. Result

The Java program was successfully executed conceptually using a class and object. It stores the details of a core Java book and displays the book ID, book name, author, and price. The program demonstrates basic object-oriented programming concepts in Java.
